

Milestone 3 Report

Group 8

April 16th, 2021

What we accomplished:

We have successfully connected the project to Google Firebase real-time database in this milestone. After conquering the problem of storing non-primitive data type, the input user data can now be stored persistently on the cloud. In this case, when the user closes the app and reopens the app, the goals data of the user can be retrieved from the database and instantly resume for the user. Besides, we have also made several changes on the UI, the font and text styles that make the app more modern looking. The notification feature and Setting View are two major parts that we will be working on next, and they will be done in the next couple of weeks. Then we can move on to the stretch goals and project finalization.
